

Good practices conceptual model

The SUGAR conceptual model will cover all the policy leverages, as well as the entire value chain for developing programmes. It will define key performance indicators for characterising good practices in an objective manner (level of impact with regards to transport operations, environmental protection, energy saving, technical achievements and political consensus). A template for data collection will be also developed. This model will be the cornerstone for all future SUGAR activities.

Good practices analysis

A transversal analysis of all good practices and innovation areas will be carried out. To ensure an extensive coverage, good practices experiences will be gathered from within the SUGAR consortium as well as from outside the partnership. This analysis will serve to define primary transfer policy areas, to create the SUGAR transfer tools, and to identify the winner of the SUGAR good practice award for a non-SUGAR site.
